

CLAIMS

1. A display apparatus, comprising:
- 5 a pair of oppositely disposed substrates at least one of which is a transparent substrate,
- a display layer, disposed between said pair of substrates, for being placed in an optical state switchable between a light transmission state and a
- 10 light interruption state, for each pixel unit,
- a reflection surface provided on one of said pair of substrates,
- a scattering layer disposed on the other substrate opposite to the substrate provided with said
- 15 reflection surface, and
- a light absorption structure or a light reflection structure, disposed at a boundary portion between adjacent pixels on the substrate provided with said reflection surface.
- 20
2. An apparatus according to Claim 1, wherein said structure is a projection-like structure or a wall-like structure.
- 25 3. An apparatus according to Claim 1 or 2, wherein said structure is a light absorption structure which absorbs not less than 60 % of incident light.

4. An apparatus according to any one of Claims 1 - 3, wherein the following relationship is satisfied:

$$\left| \frac{6\sqrt{2} \cdot d - 9 \cdot (2h + d)XY}{8Y^2 - X^2} \right| \leq 0.5p$$

$$X = \frac{1}{9} \left\{ 2\sqrt{2} \cos \Theta + 2\sqrt{6} \sin \Theta - \sqrt{9 - (\cos \Theta + \sqrt{3} \sin \Theta)^2} \right\},$$

$$Y = \frac{1}{9} \left\{ \cos \Theta + \sqrt{3} \sin \Theta + 2\sqrt{18 - 2 \cdot (\cos \Theta + \sqrt{3} \sin \Theta)^2} \right\},$$

5 wherein d represents a height of said structure, p represents a pixel pitch, h represents a distance between said scattering layer and said structure, and T represents a scattering angle defined as 1/2 of an angle at which an intensity of light transmitted through said scattering layer while being scattered in said scattering layer is 1/2 of an intensity of light transmitted through said scattering layer in a straight line.

15

5. An apparatus according to Claim 4, wherein the height d of said structure is not less than 5 μm .

6. An apparatus according to any one of Claims 1 - 5, wherein each pixel has a rectangular shape, and said structure is disposed at a boundary portion between adjacent pixels along at least a long side of a rectangular pixel.

7. An apparatus according to any one of Claims
1 - 5, wherein each pixel has a rectangular shape
having a side located at its lower portion during
5 image formation, and said structure is disposed along
said side.

8. An apparatus according to any one of Claims
1 - 7, wherein said structure has a refractive index
10 n_w which is larger than a refractive index n_d of said
display layer.

9. An apparatus according to any one of Claims
1 - 8, wherein said display layer is a liquid crystal
15 layer.

10. An apparatus according to any one of Claims
1 - 8, wherein said display layer comprises light
absorbing charged particles and a liquid for
20 dispersing the charged particles therein.

11. An apparatus according to Claim 10, wherein
said display layer is partitioned by a partition wall
for each pixel and when said display layer is in a
25 light transmission state, said structure is formed of
the charged particles which are deposited along the
partition wall.

12. An apparatus according to any one of Claims
1 - 11, wherein said apparatus has a resolution of not
less than 200 pixels per inch.
